Hard Drive Inspector for Notebooks is a health monitor application for hard disks embedded inside notebooks, allowing users to keep tabs on temperature and other critical parameters that can indicate disk failures. Hard Drive Inspector for Notebooks was built on top of its sibling, the Professional edition, but it's oriented towards portable devices and specially tailored to comply with the specific characteristics of such systems. The application is oriented on providing data loss prevention information, being able to continuously monitor the hard drive for upcoming fatal failures and notifying you of this accordingly. Therefore, you will be able to take action before you lose the tons of data you have stored on your HDD. There are two modes of experimenting with the application: the Basic mode provides a brief summary of the drive's current health, with indicators for reliability, performance and error resistance, whereas the Advanced mode comprises a more detailed overview. This includes an extensive system info report on the drive, including logical and physical geometry details (number of cylinders, sectors, etc), as well as an in-depth S.M.A.R.T. analysis, which highlights the state of the sensors and plays a major role in disk failure prevention. The application checks critical parameters every 10 minutes (you can change this from the Options menu), warning you if the drive's performance has reached a severe level of unreliability by sending network or email messages and by playing sound alerts if high temperatures have been detected. Overall, the general impression that Hard Drive Inspector for Notebooks makes is that of a steady and reliable program that can help users identify important HDD issues before they cause failures and data loss. The program features a comprehensive data logger and visualizer that continuously measures hardware and software metrics and checks them over time to monitor reliability and health. The program implements a PPS signal generator that detects and analyzes the signal on the disk surface and assesses the integrity of the magnetic medium. It also captures the critical values of S.M.A.R.T. (self-monitoring, analysis and reporting technology) and sends them to the clipboard. The program can connect to a network share and saves its data directly on the network. It also records additional information about the computer, including hardware and software versions, processor speed, and BIOS version. The configuration can be saved to any of the included file types or locally to a ZIP archive. A detailed documentation with screenshots and hardware specifications is included. Installation: Run the executable (note the icon) to start the configuration tool, the program will locate all the hardware that is connected to the computer. Once the installation is complete, a welcome screen will show, press OK to continue. The basic idea is that it keeps monitoring the hard drive and is capable of detecting imminent drive failures. However, the program only alerts you when the drive is about to go down. While the program is handy, it lacks the power to drive-up a drive when something does not look quite right. Fortunately, the developer is offering a paid version which
