Darkroom edits are different from other standard Photoshop editing operations. For example, adding noise or double-toning the distinct layers of an image in the face of the brightness of the background is asking for trouble. In addition, you can't really work on a single image if there is no 100% overlay layer available for reference. This is one of the key reasons why I love traditional darkroom work: there is always a print sitting there for reference. Using layers in Photoshop is a bit like saying you are going to paint on a board that has no paint on it — it's just not possible. Photographically speaking, of course, that's also not a good idea. When working with the full-color Photoshop images though, it is a popular option to apply a "black & white" filter to every image in the stack so that you can make very selective toning and saturation changes. This is a great approach, especially for manipulating skin tones, but it doesn't work so well if you have to apply the same modification to images that are sitting in the background of different master elements. With the installed controls, you can apply exactly the changes you want to a particular image. It may not be quite as nuanced as a multi-layer adjustment, but it's still extremely powerful when it comes to deep toning and saturation changes. I'm reminded of our old Samsung Galaxy S3 review, which was a fantastic smartphone but only marginally ahead of the competition. It had tons of potential, but then none of it was delivered on. The same applies for the Pixel: you're not getting all the features you'd expect from a premium smartphone on a budget, nor are you being offered a high-quality experience at a low cost.

The blur tool allows you to soften the subject's edges and blur them. We can use this tool to soften the edges of our subject, make it more abstract, or blur the edges so they become more transparent. **What It Does:** Stroke tools allows you to add highlights, shadows, and textures to your images. We can add both dark and light areas to our subject or make it more abstract to add new depth or interest. Fish-eye (blurry) and motion blur tools gives us the ability to slow down or speed up the motion of our object while adding highlights and shadows to make it more realistic. **What It Does:** The Pen tool allows you to trace your subject with a stylus. You can select a desired color and blend that shape in your subject, apply a stroke and paint the shape onto your photo. The Magic Wand tool is a great tool for selecting the best areas of your image(s). You can also manually trace a selection by clicking/dragging in the image. It's also a great tool to remove any unwanted portions of the image. **What It Does:** Clone tool lets you split and merge your layers on the page. The layer is applied to another section of the image by cloning the image. It's also possible to alter the size of the image by enlarging a small area. Duplicate layer allows you to create multiple duplicates of a layer on the page and it's also possible to create a smart object by turning it into a clipping layer. Before the duplication of the layer, the layer is flattened. The layer is no longer visible when merged with the original layer copy. Alignment layers let you control the direction of the layer. Smart Objects can be resized, moved, or added to an existing image. e3d0a04c9c
